

ACTIVITY: SPEAKING 3

UNIT 12: Innovation

Innovation

To address littering on the streets, we could consider implementing public awareness campaigns and education about the importance of keeping the environment clean. Additionally, we could establish more efficient and accessible garbage collection systems for the community, such as additional trash bins or broader recycling programs.

Regarding mobile and social media addiction, we could explore the possibility of setting time limits for mobile device and social media usage, both on an individual level and within schools or workplaces. We could also promote mindful technology use through awareness campaigns and education programs about balancing digital life with real life.

To tackle the lack of internet connectivity, we could seek innovative technological solutions, such as implementing satellite internet networks or utilizing state-of-the-art wireless technologies. Furthermore, we could work in partnership with private companies and government organizations to expand internet infrastructure in rural areas and underserved communities.

In conclusion, to address future needs related to these contemporary issues, we would want to consider solutions that promote education and public awareness, utilize innovative technologies, and foster collaboration across different sectors of society. We may be able to employ multidisciplinary approaches and adaptive strategies to effectively tackle these challenges.
